## Carlos,

In the NW gap area its 12-inches minimum, class A rock (80% recycled concrete, 3-inch median diameter -  $d_{50}$ , 20% filter gravel). As per final report - no geotextile - NW gap area is just outside of area covered by geotextile & geomembrane. Manual probing (approx. 30' by 30' grid) after construction confirmed thickness OK at probing locations – attached.

## Val/Gary,

For the area where the gap is located, what did the cap design consist of, for example 6 inches of rock, 3 inches of sand, geotextile, etc. CAS
